

By Josh Kidd

Below is a map of an archipelago of a lost civilization. A series of bridges connect all of the islands so that any island can be reached from any other island. Bridges may only run orthogonally and no more than two bridges can connect any pair of islands. Bridges may not cross other bridges or islands. The shape and orientation of the islands represent the number of bridges connected to that island. Can you decipher the shapes and reconstruct the map of the bridges?
