

Below is a map of an archipelago of a lost civilization who used symbols different from our own for their numbers. A series of bridges connect all of the islands so that any island can be reached from any other island by crossing a series of bridges. Bridges may only run orthogonally and no more than two bridges can connect any pair of islands. Bridges may not cross other bridges or islands. The symbols on the islands represent the number of bridges connected to that island. Can you decipher the symbols and reconstruct the map of the bridges?
